

EXTENDING SERVICE LIFE

Due to their location and their critical nature as part of a country's infrastructure, concrete structures in the Power and Utilities sector must endure the destructive effects of hydrostatic pressure and chemical attack. The durability of concrete is often affected by corrosion, sulphate attack and Alkali Aggregate Reaction. Without proper protection, the structural integrity of reinforced concrete is soon compromised, leading to expensive remediation efforts and a shortened life span. Whether for new construction or structural rehabilitation, Xypex Crystalline Technology has proven to be a permanent and cost effective solution for extending the service life of all types of concrete structures in the utilities and power generation industry.
